* NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arrively. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wen,G., Siebert,R., Schilhabel,M.B., Chromosome 8 genomic sequence Unpublished

Genetically engineering the biosynthetic pathways in plants involved the accumulation of sterol compounds and tocopherol to produce compounds for lowering the level of low density lipoprotein cholester in blood serum .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This isolated nucleic acid molecule encodes human acylcoenzyme A:cholesterol acyltransferase II (see AAW43406), or ACAT related gene product I (ARGP-1), that is expressed at high levels in intestine and is a candidate for sterol esterification in these tissues. It was identified following database searching for human ACAT-related sequences and use of PCR and RACE to obtain full-length sequences. An isolated nucleic acid (see AAV01534) for human ARGP-2 (see AAW43407) was also identified. Also claimed are host vector systems for production of ARGP polypeptides, and transgenic non-human mammals. ARGP-1 and ARGP-2 nucleic acids can be used to diagnose or treat a subject who has an imbalance in sterol levels due to a defect in sterol esterification. A claimed oligonucleotide capable of encorifically bythridisting to a minuma segmence of minipartine in the
                                                                                                                                      WPI; 2000-665136/64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                         Novel polynucleotides used for modifying plant oil composition and for developing products for treating e.g. cancer, diabetes, cardiopulmonar disease or metabolic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sterol brassicastanol. Oil obtained from the seeds can be used in food and pharmaceutical compositions to lower levels of low density lipoprotein cholesterol in blood serum. ACAT enzymes can be used in the present invention to produce elevated levels of phytosterol and/or phytostanol esters.
                                                                                                                                                                                                                                                    05-JUN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            homeostasis. The present sequence is the coding sequence of human ACAT Related Gene Product 1 (ARGP1). The enzyme encoded by the present sequence is a diacylglycerol acyltransferase (DCAT). ARGP1 does not esterify cholesterol. It is thought therefore that ARCP1 participates in the Coenzyme A-dependent acylation of substrate(s) other than cholesterol e.g. diacylglycerol. Also, ARGP1 has a predicted diacylglycerol binding motif, suggesting that it may perform the last acylation in triglyceride biosynthesis. ARGP1 gene and protein are useful for treating a subject who has an imbalance in triglyceride levels due to a defect in esterification of diglycerol, via gene therapy. Particularly, ARGP1 is useful for treating hypertriglyceridemia, hyperlipidaemia, atherosclerosis, heart disease, obesity or other diseases associated with high or excessive levels of triglyceride.
                                                       This is the nucleotide sequence of a nucleic acid of the human cell line SH-SY5Y, used in the method proteins. The invention involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; SH-SY5Y; apoptosis; antibody; immunohistological staining; inhibition; ds.

The present invention relates to oligonucleotides based on nucleotide CC sequences obtained from both wild-type tubercle bacilli (wtTB) that are CC susceptible to a drug and mutant-type tubercle bacilli (wtTB) that are CC resistant to a drug and mutant-type tubercle bacilli (mtTB) that are CC rifampicin (RFP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and CC resistance (EB). The rpoB gene is responsible for resistance to RFP; the CC responsible for resistance to SM, the inhA gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; the satG gene is responsible for for invention also relates to nucleic acid probes having part of a nucleotide confidence of tubercle bacilli (TB) responsible for drug resistance and CC primers used to generate the probes. The present sequence is an occupance of the present invention. The oligonucleotides of the present invention can be used to enable the differentiation of drug cresistance and the determination of infection with tubercle bacilli

```
The present sequence is that of the Mycobacterium tuberculosis CC embB (ethambutol resistance) gene (bp7741-8040). Amplification CC and cycle sequencing primers (see AAA4983-62) are used for the CC detection and analysis of antibiotic resistance-associated mutations CC PR (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (cc (streptomycin)) and 23S (azithromycin) genes of M. tuberculosis. CC (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. CC (haracterization of M. tuberculosis present in a sputum sample. CC without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 cm d. 23S genes for the presence of antibiotic mithousis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the sence of antibiotic resistance-inducing mutations. Genotypic customic contributic resistance-inducing mutations. Genotypic antibiotic resistance-inducing mutations. Genotypic contribiotic resistance-inducing mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       XX XXX XXX OS OS FT FT FT FT FT FT FT FT

                                                                                                                                                                                                                                                                             The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, catholic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides encoding human secreted proteins - derived e.g. human blood, kidney, foetal lung, placenta, testes, brain ovary, pituitary, retina and colon cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; expressed sequence tag; EST; haematopoiesis; tissue growth; activin; inhibin; chemotaxis; chemokinesis; haemostatic; receptor; ligand; thrombolytic; anti-inflammatory; cadherin; anti-tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprise at least one cytokine-encoding DNA sequence. The expression of cytokines in mammals can up-regulate immune responses to the immunegens. The cytokine is selected from interleukins (IL), colony stimulating factors (CSF), interferons (IFN) and tumour necrosis factors (TMF). The BHV-2 based vector or recombinant virus can be used as vaccines. They can be used for preventing or treating a mucosal disease in a subject, e.g. ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly mastitis in cows or breast cancers in humans. They can also be used for preventing or treating a stress-induced disease. The present sequence represents a BHV-2 thymidine kinase partial gene sequence, BHV-2UK cloned for use in the invention. This differs from the previously published sequence BHV-2NY-1 by having adenine at position 727 (full length)

                                                                                                                                                                                                                                                                                                            AAQ13722;
                                                                                                                                                                                                                                                                                                                                    AAQ13722 standard; DNA; 1234 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprise at least one cytokine-encoding DNA sequence. The expression of cytokines in mammals can up-regulate immune responses to the immunogens. The cytokine is selected from interleukins (IL), colony stimulating factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The BHV-2 based vector or recombinant virus can be used as vaccines. They can be used for preventing or treating a mucosal disease in a subject, e.g. ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly mastitis in cows or breast cancers in humans. They can also be used for preventing or treating a stress-induced disease. The present sequence represents the partial sequence of a previously published BHV-2 thymidine kinase, BHV-2NY-1. The cloned BHV-2UK sequence (AAX91501) of the invention differs from the present sequence BHV-2NY-1 by having adenine at position 727 (full length) instead of guanine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 559 BP; 123 A; 178 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides bovine herpes virus-2 (BHV-2) based vectors that comprise at least one cytokine-encoding DNA sequence. Bacteriol., 158:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene dehydrogenase 4H, lycopene cyclase, beta carotene hydroxylase, and zeaxanthin glycosylase are represented in ANQ13716, ANQ13718, ANQ13719, ANQ13722, ANQ13724 and ANQ13726 respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The native sequence (AAQ13722) was genetically engineered for use expression in yeast. At the 5' end of the gene, the native initiation GTG codon has been an ATG codon. The second amino acid residue, Arg, was originally encoded by an AGG codon that was changed to a CGG codon, while retaining its coding for the Arg amino acid residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant expression plasmids can be used of the enzymes and hence large amts. of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Manipulation of the present sequence, the lycopene cyclase coding sequence, by in frame linkage to the chloroplast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene can lead to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further C40 carotenoids such as zeaxanthin and zeaxanthin diglucoside. Other enzymes involved in the carotenoid biosynthesis pathway include geranylgeranyl pyrophosphate (AAW01113), phytoene synthase (W01121) and phytoene dehydrogenase-4H (AAW01123).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing prodm. of total carotenoid(s) in a higher plant - transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase st

Yarger J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a recombinant lycopene cyclase coding sequence. The approx. 1142 bp SphI-BamHI fragment present in the plasmid pARC1509 (ATCC 40850) is used to transform plants in order to increase the level of carotenoids produced by plants. Manipulation of it by in frame linkage to the chloroplast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene can lead to increased production of total carotenoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and beta-carotene is an effective and apparently harmless food colourant and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            is also in the pathway for biological synthesis of further C40 carotenoids such as zeaxanthin and zeaxanthin diglucoside. Other enzymes involved in the carotenoid biosynthesis pathway include geranylgeranyl pyrophosphate (AAW01119), phytoene synthase (WO1121) and phytoene dehydrogenase-4H (AAW01123).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 17; Fig 19; 99pp; English.

                                                                                                                                                                                               A novel DNA molecule has been isolated which encodes an Erwinia herbicola lycopene cyclase enzyme that converts lycopene to beta-carottene? The DNA molecule comprises at least 1125 bp and is present in the plasmids pARC147, pARC1509, pARC1510 and pARC1520. The present sequence represents the structural gene for lycopene cyclase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yearsts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer.
